The Subject Index for Volume 47 will appear in the December 1981 issue as part of a cumulative index for the year 1981.

INFORMATION FOR AUTHORS

ICARUS is devoted to the publication of original contributions in the field of solar system studies. Manuscripts reporting the results of new research—observational, experimental, or theoretical—concerning the astronomy, geology, meteorology, physics, chemistry, biology, and other scientific aspects of the solar or extrasolar systems are welcome. The journal generally does not publish papers devoted *exclusively* to the Sun, the Earth, celestial mechanics, or astrophysics. The preferred language of publication is English, but in special cases manuscripts are considered in French, German, or Russian. All papers are reviewed, generally by two independent referees. Authors may be asked to respond to criticisms and suggestions by the referees prior to publication.

Manuscripts are accepted for review with the understanding that the same work has not been and will not be published, nor is presently submitted elsewhere, and that all persons listed as authors have given their approval for the submission of the paper; further, that any person cited as a source of personal communication has approved such citation. Written authorization may be required at the Editor's discretion. Articles and any other material published in *Icarus* represent the opinions of the authors and should not be construed to reflect the opinions of the Editors or the Publisher.

Authors submitting a manuscript do so on the understanding that if it is accepted for publication, copyright in the article, including the right to reproduce the article in all forms and media, shall be assigned exclusively to the Publisher. The Publisher will not refuse any reasonable request by the author for permission to reproduce any of his or her contributions to the journal.

There are no page charges. However, authors will be charged for color reproduction; the publisher will provide an estimate of cost on request. Fifty *reprints* of each paper will be furnished gratis to the author and additional reprints may be purchased.

Manuscripts. **Four copies** of the manuscript, including figures, tables, etc., should be submitted to **Dr. Joseph A. Burns, Space Sciences Building, Cornell University, Ithaca, New York 14853, telephone: 607-256-4875.** Authors should retain the original typescript. One of the four sets of figures should be suitable for camera-ready reproduction. All manuscripts must be typewritten with wide margins and **double-spaced throughout,** including references and footnotes. Number each page of the manuscript. Include on the first page the title and the name(s) and affiliation(s) of all author(s), including mailing address(es). At the bottom of this page note the number of manuscript pages, figures, and tables. On the second page indicate a proposed running head of not more than 35 characters, and the name and address to which editorial correspondence and proofs should be directed. The third page should contain a brief abstract, and the text should begin on the following page. Following the main text, give Appendixes, Acknowledgments, references, tables, figure captions, and figures, in that order. Places where figures and tables are to appear in the published paper should be marked in the margins of the manuscript.

Tables are to be numbered consecutively with Roman numerals in order of their citation in the text. Each table should be typed, **double-spaced,** on a separate sheet with due regard to the proportions of the printed page. All tables should bear appropriate headings.

Figures. At the time of submission of the manuscript, one original of each figure is to be submitted in such form as to permit photographic reproduction without redrawing: Line drawings should be carefully drafted, no larger than 22 × 30 cm. Both original drawings or standard glossy photographic reproductions are acceptable. The lettering should be large enough to allow a reduction to $\frac{1}{3}$ the original size. **Each figure should be identified with the author's name and figure number.** All figures, whether line drawings or halftones, should be numbered consecutively in Arabic numerals, in order of their citation in the text. Figure captions should be typewritten on a separate sheet, following the text. Color plates and foldouts are published at the author's expense.

Literature citations in the text should be in one of the following forms: Morrison and Cruikshank, 1974 (for two authors); Marov *et al.*, 1980 (for three or more authors); Walker, 1977, p. 198 (for reference to a specific page). To distinguish two or more works by the same author(s) in the same year, use suffixes a, b, etc., following the year (e.g., Öpik, 1976a, 1976b).

Literature citations in the bibliography should be **listed alphabetically** according to the surname of the (first) author. Journal references should contain the **names and initials of all authors, the year, the title of the article, the standard abbreviation of the journal, the volume number, and the first and last page numbers.** Titles of journals and books should be in italics, volume numbers in boldface. (In a typed manuscript, indicate italics by single underlining and boldface by wavy underlining.) Below are shown examples of the proper reference forms for a journal article, a book chapter, and a book, respectively.

CAMERON, A. G. W. (1973). Abundances of the elements in the solar system. *Space Sci. Rev.* **15,** 121–146.

ZHARKOV, V. N., AND TRUBITSYN, V. P. (1976). Structure, composition and gravitational field of Jupiter. In *Jupiter* (T. Gehrels, Ed.), pp. 133–175. Univ. of Arizona Press, Tucson.

WASSON, J. T. (1974). *Meteorites: Classification and Properties.* Springer-Verlag, New York.

Careful compliance with these instructions for the preparation of the list of references is required; manuscripts with incomplete references (or missing abstracts) may be returned to the author for correction before being considered for publication.

Guidelines for Submission of "Notes": Papers on especially topical subjects will be given unusually rapid handling if they satisfy the following limitations on length:

(i) Manuscripts should be typed double-spaced and should be no longer than nine pages, including a very brief abstract of one or two sentences.

(ii) The sum of figures and tables should be less than, or equal to, two.

We expect that ICARUS will publish "Notes" within four months of submission. We will try to complete refereeing and editorial handling in less than one month. In order to accelerate publication, proofs of "Notes" will be proofread at Academic Press.

Please write with attention to organization, style, and especially brevity. Present results logically, with order dictated by the needs of the reader. Take special care in composing the title and abstract, since these will be the most frequently read sections of the paper. In the title, specific words are preferable to general ones. The abstract should summarize the conclusions of the research, including quantitative results where appropriate, rather than merely stating the problem.

Whenever possible, quotients in mathematical expressions should employ the solidus (/) rather than being displayed in built-up form. However, for units, exponential notation is preferred (e.g., erg cm^{-2} s^{-1}, not erg/cm^2s). Most authors will recall the difference between "i.e." and "e.g.," will note that such nouns as "data" are plural and "mare" singular, and will take care to insert a zero before decimal fractions lying between $+1$ and -1.

Proofs will be sent to authors. When submitting a manuscript, the author should include a list of the symbols employed, identified typographically, not mathematically. This list will not be printed, but will help to avoid costly author's corrections in proof. Authors will be charged for excessive alterations in proof.

Proceedings of a NATO Advanced Study Institute held at the University of Newcastle upon Tyne, March-April 1979

Mechanisms of Continental Drift and Plate Tectonics

edited by P.A. Davies and S.K. Runcorn

December 1980/January 1981, xiv + 362pp., £30.00 (UK only)/$72.00, 0.12.206160.8

The present book draws together, for the first time in one volume, current research on the mechanisms of continental drift and plate tectonics. The various theories which have been put forward for the causes of plate motions are critically appraised in the light of existing geophysical, geological and geochemical data.

The Earth: Its Origin, Structure and Evolution

edited by M.W. McElhinny

1979, xiv + 598pp., £36.00 (UK only) / $83.00, 0.12.482750.0

The book begins by discussing the origins of the Earth, and goes on to consider its composition and structure, from core to crust, as deduced from seismology, geomagnetism and laboratory studies of phase transitions and physical properties at high temperatures and pressures. Geochemical aspects of the evolution of the upper mantle and crust are also discussed, including the origin of magmas, porphyry and copper deposits.

Gravity, Deformation and the Earth's Crust

APL 1065

Second Edition

Hans Ramberg

May/June 1981, £32.80 (UK only)/$79.00, 0.12.576860.5

The first edition of *Gravity, Deformity and the Earth's Crust* made an extremely important contribution to the geological sciences by illustrating how problems in geodynamics and tectonics can be illuminated by the use of experimental scale models combined with theoretical mechanics analysis. In the second edition this approach has been extended, on the one hand to include new details and analysis of structures described in the first edition, and on the other to encompass further geological problems which have arisen since the first publication.

Geothermal Systems

John W. Eider

March 1981, x + 502pp., £20.60 (UK only) / $49.50, 0.12.236450.3

Rather than presenting a broad study of the hot Earth, the book concentrates on how the heat gets out — it deals with heat and mass *transfer* in lithothermal and hydrothermal systems deriving their energy from a vigorously convecting mantle, with emphasis on the mechanisms by which energy is delivered to the surface. The author has sought to bridge the gap between large-scale volcanic and small-scale hydrothermal systems, and provides evidence for considering these apparently very different kinds of system together.
